

30V, 1A Single Cell Li-Ion & Li-Pol Linear Battery Charger

General Description

The DS6511 series of devices are highly integrated Li-Ion and Li-Pol linear chargers devices targeted at space-limited portable applications.

The battery is charged in three phases: conditioning, constant current and constant voltage. In all charge phases, an internal control loop monitors the IC junction temperature and reduces the charge current if an internal temperature threshold is exceeded.

The charger power stage and charge current sense functions are fully integrated. The charger function has high accuracy current and voltage regulation loops, charge status display, and charge termination.

The fast charge current value is also programmable via an external resistor.

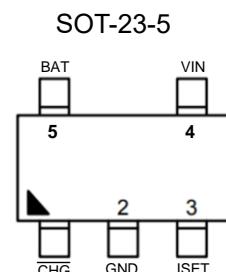

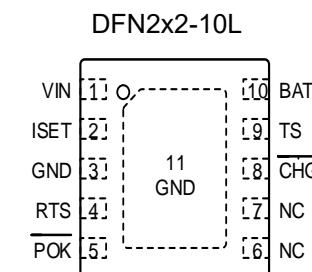

Features

- 30V Input Rating; with 7.36V Input Overvoltage Protection
- 1% Charge Voltage Accuracy
- Programmable Charger Current 100mA to 1A
- 125°C Thermal Regulation
- Fixed ISET / 10 for Termination of Charge Current
- Fixed ISET / 3 for Pre-Charge Current
- Operation over JEITA Range via Battery NTC – 1/2 Fast-Charge-Current at Cold, and 4.05V at Hot
- Adjustable Temperature Sense Current
- Very Low Battery leakage Current 0.1uA
- Prevent Battery Reverse Connection Function
- DFN2x2-10L & DFN3x3-12L & SOT-23-5 Package Available

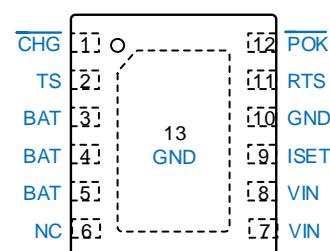

Applications

- Laptop, Palmtops and PDAs
- Smart Phones
- MP3 Players
- Low-Power Handheld Devices
- TWS & E-Cig

Pin Configurations

DFN3x3-12L

Ordering Information

DS6511_X_{YY}

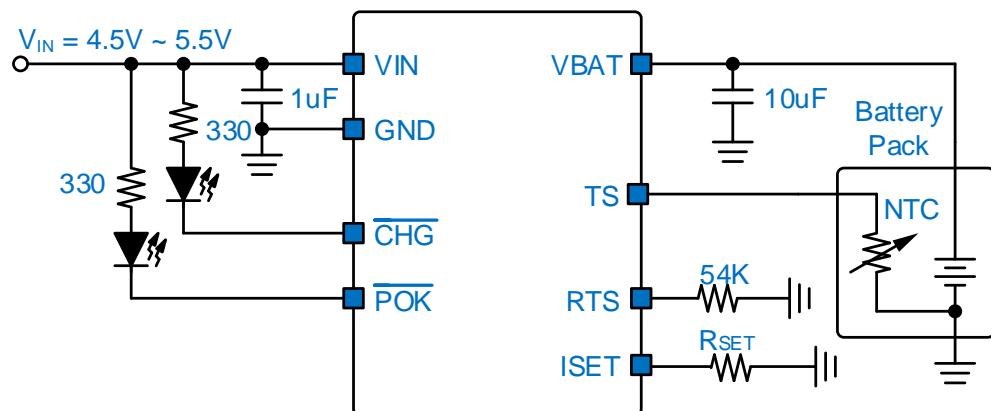

Designator	Description	Symbol	Description
X	V{BAT}	A	4.2V
		B	4.35V
_{YY}	Package type	S5	SOT-23-5
		D10	DFN2x2-10L
		D12	DFN3x3-12L

Example: $V_{BAT}=4.2V$, DFN2x2-10L. Part no = DS6511AD10

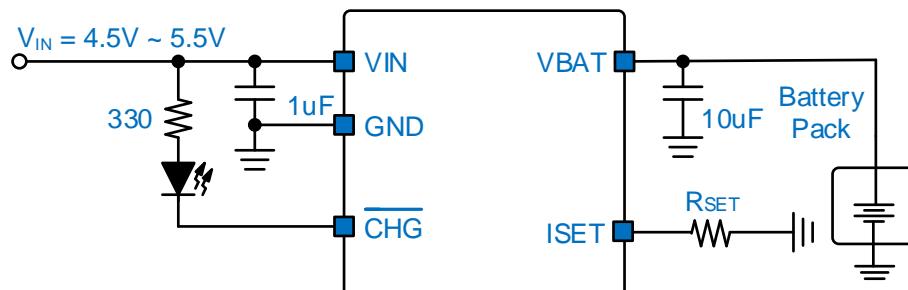

Description of Functional Pins

Pin No			Pin Name	Pin Function
DFN-2X2	DFN-3X3	SOT23-5		
1	7 , 8	4	VIN	Input of Supply Voltage .
2	9	3	ISET	Programs the Fast-charge current setting. External resistor from ISET to VSS defines fast charge current value. Range is 16.2 KΩ (300mA) to 2.4KΩ (1000mA) .
3	10	2	GND	Ground .
4	11		RTS	Programs the Temperature Sense (TS) current setting. External resistor from RTS to VSS defines the output current of TS pin. Let the RTS pin floating if there is no TS requirement.
5	12		POK	Low (FET on) indicates the input voltage is above UVLO , and less than OVP threshold voltage.
6	6		NC	No Internal Connection.
7			NC	No Internal Connection.
8	1	1	CHG	Low (FET on) indicates charging and Open Drain (FET off) indicates no Charging or Charge complete.
9	2		TS	Temperature sense terminal connected to 10k & 100k at 25°C NTC thermistor, in the battery pack. Floating TS terminal or pulling High disables TS monitoring. Pulling terminal Low disables the IC. Let the RTS pin floating if there is no TS requirement.
10	3, 4, 5	5	BAT	Battery Connection. System Load may be connected. Expected range of bypass capacitors 10µF to 22µF.
Exposed Pad	Exposed Pad		PGND	Substrate of Chip. Leave floating or tie to GND.

Typical Application Circuits

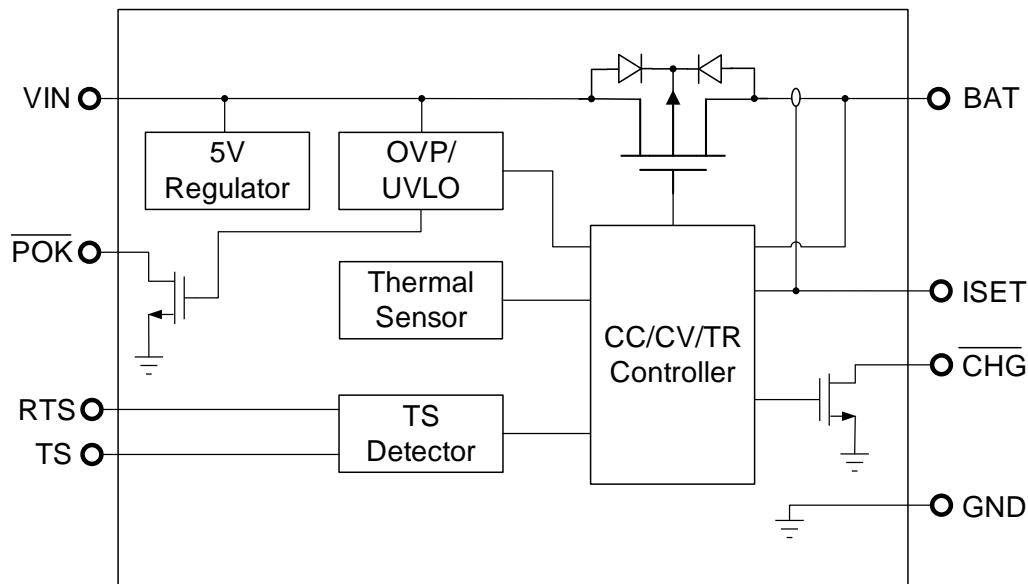

DFN2x2-10L & DFN3x3-12L

SOT-23-5

Function Block Diagram

Absolute Maximum Ratings (Note 1)

VIN to GND -----	-0.3V to 30V
BAT to GND -----	-0.3V to 12V
Other to GND -----	-0.3V to 6V

Package Thermal Resistance (Note 2)

SOT-23-5, θ_{JA} -----	200 °C /W
DFN2x2-10L, θ_{JA} -----	95 °C /W
DFN3x3-12L, θ_{JA} -----	70 °C /W
Lead Temperature (Soldering, 10 sec.) -----	260 °C
Junction Temperature -----	150 °C
Storage Temperature Range -----	-60 °C to 150 °C
ESD Susceptibility	
HBM -----	2KV
MM -----	200V

Recommended Operating Conditions

Input Voltage VIN -----	4.6V to 24V
Junction Temperature Range -----	-40 °C to 125 °C
Ambient Temperature Range -----	-40 °C to 85 °C

Electrical Characteristics

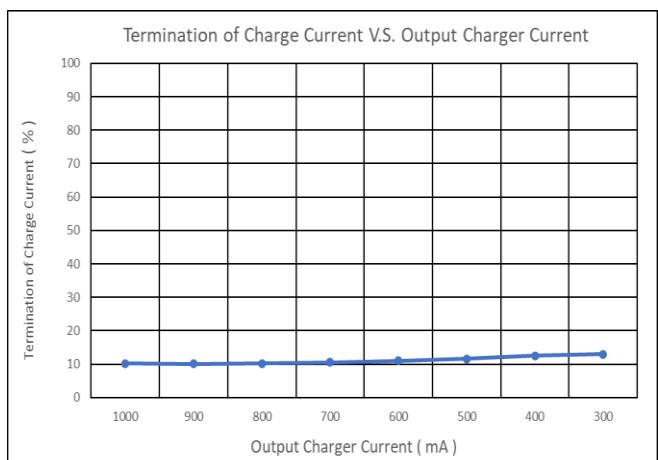

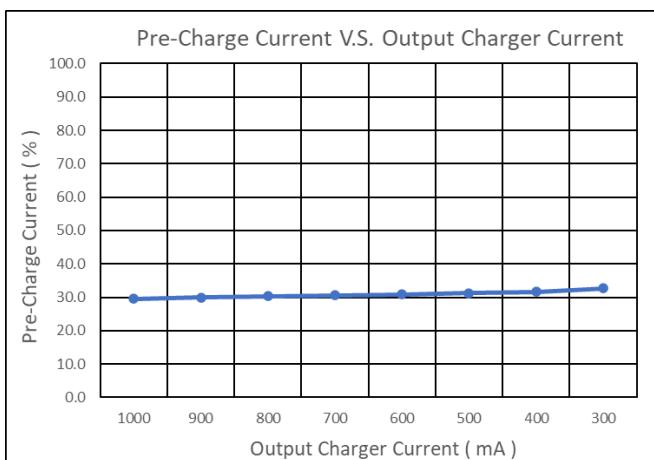

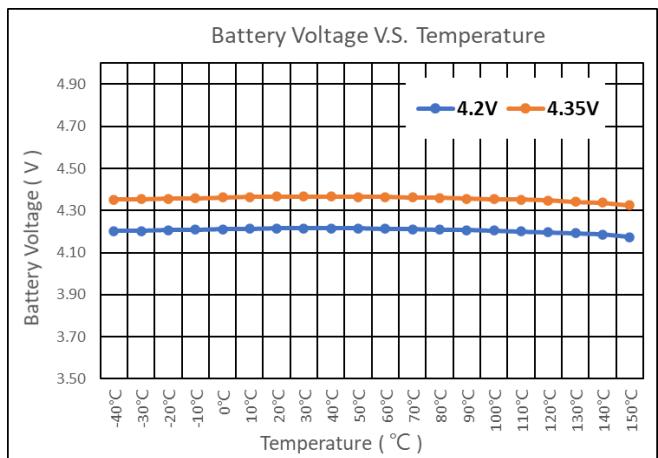

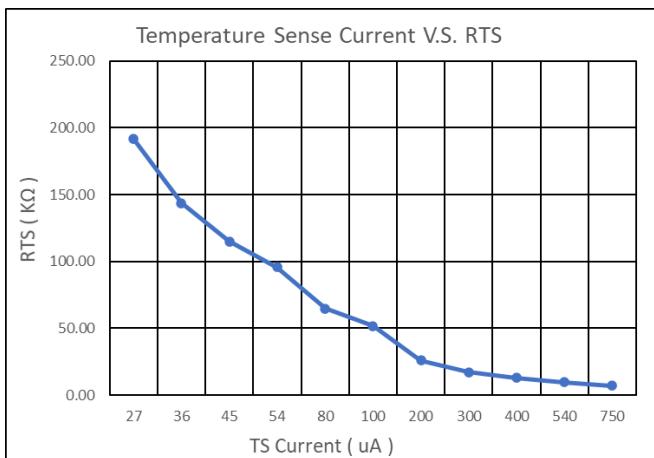

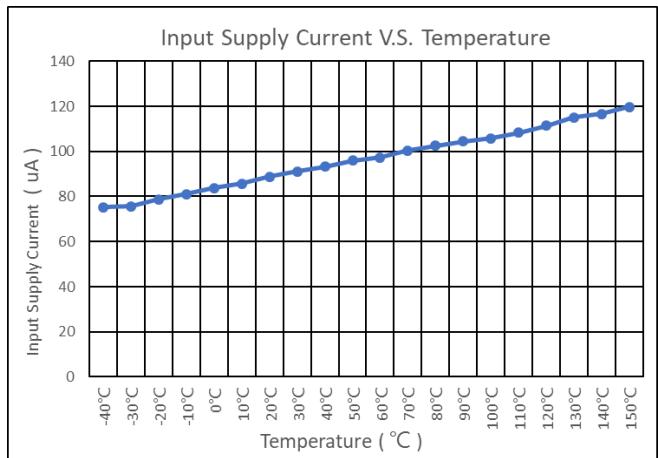

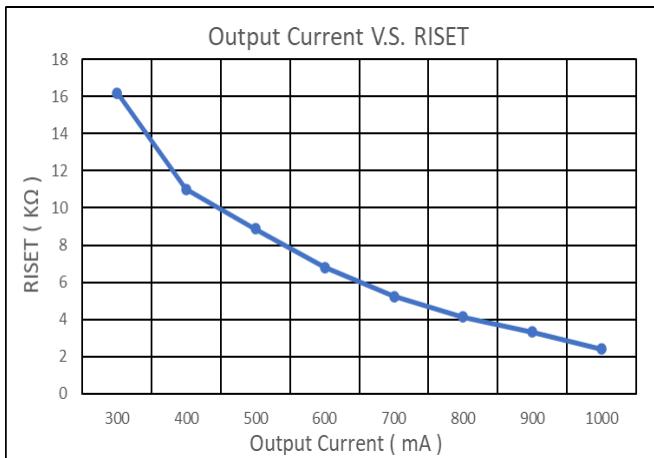

($V_{IN} = 5V$, $T_A = 25^\circ C$ unless otherwise specified)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
Supply Voltage	V_{IN}		4.6	--	24	V
UVLO Threshold Voltage	V_{IN_UVLO}	V_{IN} Rising	--	4.5	--	V
UVLO Hysteresis Voltage	V_{UVLO_HYS}		--	100	--	mV
Input Over-Voltage Protection	V_{OVP}			7.36		V
Input Over-Voltage Protection Hysteresis	V_{OVP_HYS}			0.1		V
Input Supply Current (Charge mode)	I_{QA}	$TS = \text{open}$, $V_{IN} = 5V$, No load on OUT terminal,		95		μA
Input Standby Current	I_{QS}	$TS = 0V$, $V_{IN} = 5V$		85		μA
Battery leakage current into BAT terminal	I_{BAT}	$V_{IN} = 0V$, $V_{BAT} = 4.2V$	--	0.1	--	μA
Reverse Battery Current into BAT terminal	I_{RBAT}	$V_{BAT} = -4.2V$		800		μA
Battery Regulation Voltage	$V_{BAT} / \text{Type A}$	$I_{OUT} = 25mA$	4.16	4.2	4.24	V
	$V_{BAT} / \text{Type B}$		4.31	4.35	4.39	
Output Current	I_{OUT}	$R_{ISET} = 2.4 K\Omega$ to $16.2 K\Omega$	300		1000	mA
Pre-charge to fast-charge transition threshold	V_{LOW}	V_{BAT} Falling	--	2.81	--	V
Temperature Sense Current	I_{TS}	$R_{RTS} = 54k\Omega$	--	100	--	μA
Low temperature CHG Pending	$V_{TS-0^\circ C}$	TS Rising	--	2.53	--	V
Hysteresis at $0^\circ C$	$V_{HYS-0^\circ C}$		--	60	--	mV
Low temperature, half charge	$V_{TS-10^\circ C}$	TS Rising	--	1.71	--	V
Hysteresis at $10^\circ C$	$V_{HYS-10^\circ C}$		--	60	--	mV
High temperature at $4.1V$	$V_{TS-45^\circ C}$	TS Falling	--	0.45	--	V
Hysteresis at $45^\circ C$	$V_{HYS-45^\circ C}$		--	17	--	mV
High temperature Disable	$V_{TS-60^\circ C}$	TS Falling	--	0.28	--	mV
Hysteresis at $60^\circ C$	$V_{HYS-60^\circ C}$		--	17	--	mV
Charge Shutdown Threshold	V_{TS_SD}	TS Falling		110		mV
Hysteresis of TS Shutdown	V_{TS_SD-HYS}			17		mV
Temperature regulation limit	$T_{J(REG)}$			125		$^\circ C$
Thermal shutdown temperature	T_{J_OFF}			155		$^\circ C$

Note 1. Stresses beyond those listed "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Note 2. θ_{JA} is measured at $T_A = 25^\circ C$ on a DSTECH EVB board.

Typical Characteristics

Power-Down or Undervoltage Lockout (UVLO)

The DS6511 is in power down mode if the VIN terminal voltage is less than UVLO. The part is considered "dead" and all the terminals are high impedance. Once the VIN voltage rises above the UVLO threshold the IC will enter Active mode.

Power-up

The IC is alive after the VIN voltage ramps above UVLO, resets all logic, and starts to perform many of the continuous monitoring routines. Typically, the input voltage quickly rises through the UVLO and declares power good.

Overvoltage-Protection (OVP)

If the input source applies an overvoltage, the pass FET, if previously on, turns off after a deglitch (OVP). The CHG and POK terminal goes to a high impedance state. Once the overvoltage returns to a normal voltage, the POK terminal goes low, charge continues and the CHG terminal goes low after a deglitch period.

Program the Temperature Sense Current , RTS

From the Electrical Characteristics table:

RTS (KΩ)	for Battery NTC
54	10K
540	100K

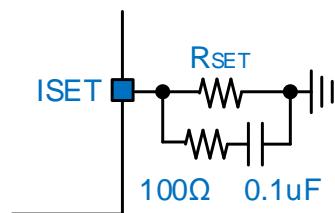

Selecting the closest standard value, use a resistor between RTS and GND.

Program the Fast Charge Current , ISET

From the Electrical Characteristics table:

RSET (KΩ)	Charge Current (mA)
118.00	100
32.40	200
16.20	300
11.00	400
8.87	500
6.81	600
5.23	700
4.12	800
3.32	900
2.40	1000

Selecting the closest standard value, use a RSET resistor between ISET and GND.

It is recommended to connect a set of RC (100Ω & 0.1uF) in parallel with the RSET resistor, which can make the charging current more stable.

CHG and POK LED Pull-up Source

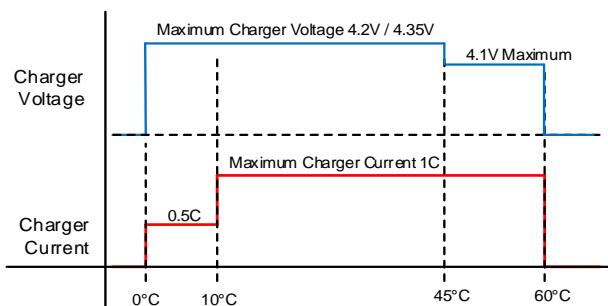

For host monitoring, a pull-up resistor is used between the "STATUS" terminal and the VCC of the host and for a visual indication a resistor in series with an LED is connected between the "STATUS" terminal and a power source. If the CHG or POK source is capable of exceeding 7V, a 6.2V Zener diode should be used to clamp the voltage. If the source is the BAT terminal, note that as the battery changes voltage, and the brightness of the LEDs vary.

Charging State	$\overline{\text{CHG}}$ FET/LED
1st Charge after VIN applied	ON
OVP or UVLO	OFF

VIN Power Good State	$\overline{\text{POK}}$ FET/LED
UVLO	OFF
OVP Mode	OFF
Normal Input (UVLO < VIN < V _{OVP})	ON
POK is independent of chip disable	

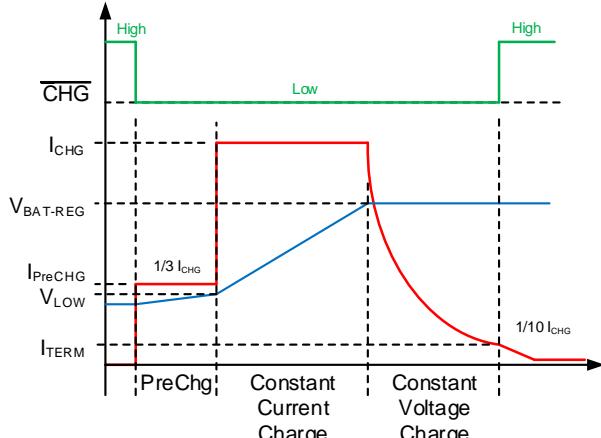

Temperature Sense (TS)

The TS function for the DS6511 is designed to follow the new JEITA temperature standard for Li-Ion and Li-Pol batteries. There are now four thresholds, 60°C, 45°C, 10°C, and 0°C. Normal operation occurs between 10°C and 45°C. If between 0°C and 10°C the charge current level is cut in half and if between 45°C and 60°C the regulation voltage is reduced to 4.1Vmax.

The TS feature is implemented using an internal by RTS set current source to bias the thermistor connected from the TS terminal to VSS. If this feature is not needed, a fixed 10KΩ can be placed between TS and VSS to allow normal operation. This may be done if the host is monitoring the thermistor and then the host would determine when to pull the TS terminal low to disable charge.

Charge Cycle

Thermal Application

For continuous operation, do not exceed the absolute maximum junction temperature. The maximum power dissipation depends on the thermal resistance of the IC package, PCB layout, rate of surrounding airflow, and difference between junction and ambient temperature. The maximum power dissipation can be calculated as below:

$$T_A = 25^\circ\text{C}, \text{ DSTECH PCB},$$

The max PD(Max) = $(125^\circ\text{C} - 25^\circ\text{C}) / (200^\circ\text{C/W}) = 0.5\text{W}$ for SOT-23-5 packages.

The max PD(Max) = $(125^\circ\text{C} - 25^\circ\text{C}) / (95^\circ\text{C/W}) = 1.05\text{W}$ for DFN2x2-10L packages.

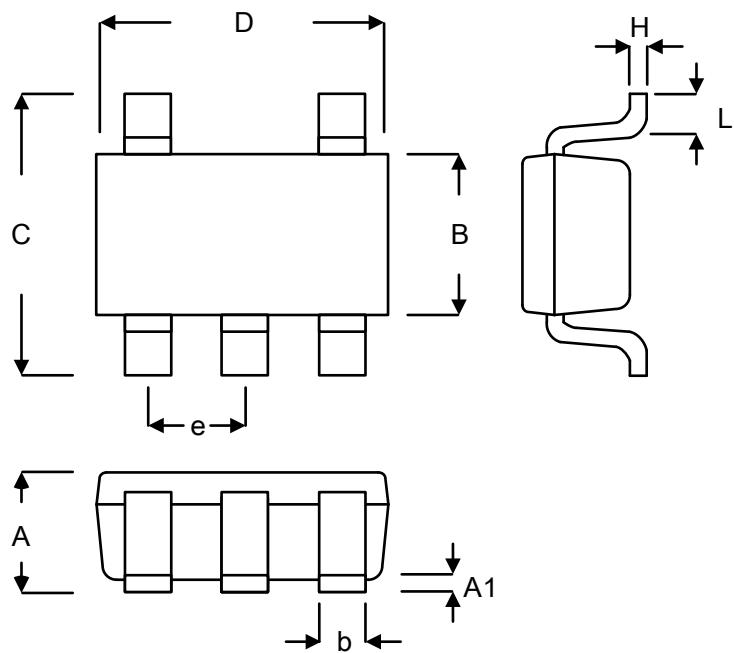

The max PD(Max) = $(125^\circ\text{C} - 25^\circ\text{C}) / (70^\circ\text{C/W}) = 1.42\text{W}$ for DFN3x3-12L packages.

Power dissipation (PD) is equal to the product of the output current and the voltage drop across the output pass element, as shown in the equation below:

$$PD = (VIN - VOUT) \times IOUT$$

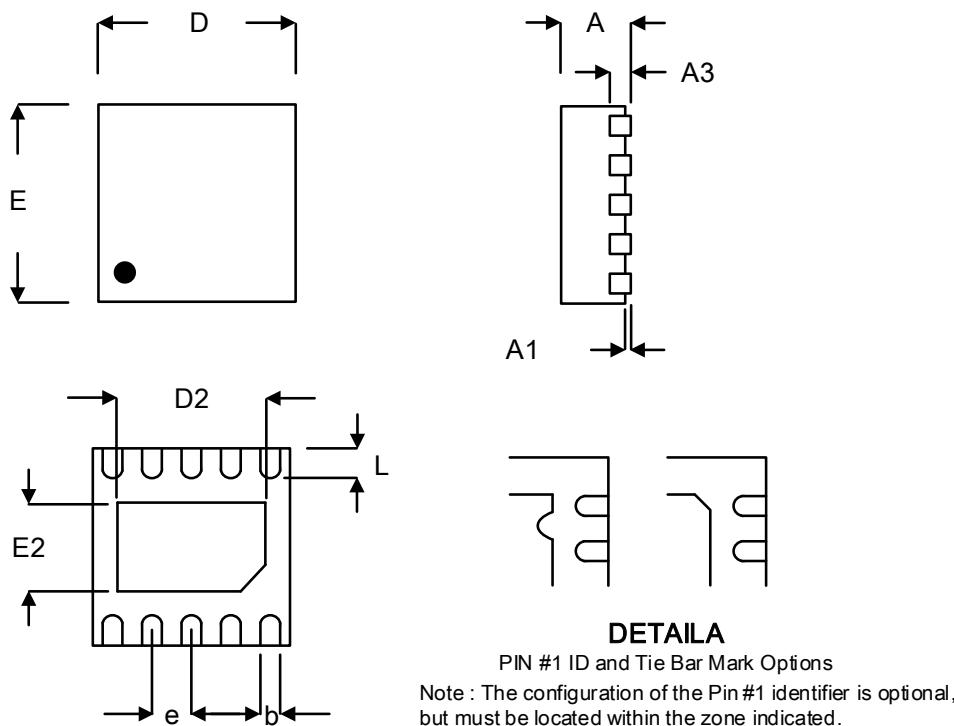

Layout Consideration

By placing input and output capacitors on the same side of the PCB as the Charger, and placing them as close as is practical to the package can achieve the best performance. The ground connections for input and output capacitors must be back to the DS6511 ground pin using as wide and as short of a copper trace as is practical. Connections using long trace lengths, narrow trace widths, and/or connections through via must be avoided. These add parasitic inductances and resistance that results in worse performance especially during transient conditions.
